Dan Isiah Matt (I presume)

inherits  
from TableEntry

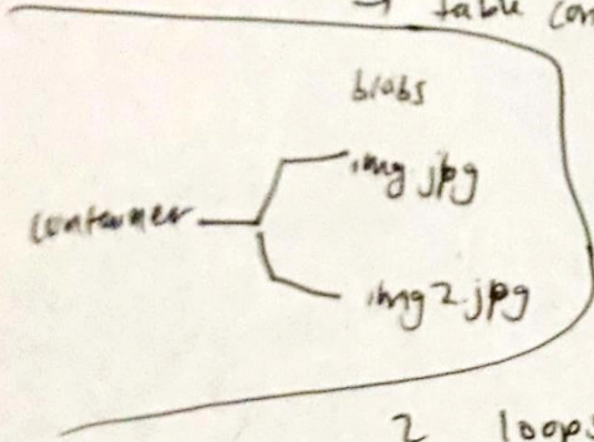

each has  
username,  
name, &  
other  
attributes

Purge Async ()

→ ImageTableResults is a list of image models

→ Table query of image models made

→ table continuation token set to null

2 loops:

— one goes through ~~table query~~ <sup>table</sup>

- takes a segment of the <sup>table</sup> query
- sets <sup>table</sup> continuation token to true if more segments left in the table query / <sup>cloud</sup> table
- waits for all results to be deleted then deletes them <sup>(deletes from cloudTable)</sup>
- keeps going until no more segments

Binary Large Object:

collection of binary data stored as a single collection in a database

— the other goes through blobs:

- before loop starts, blob continuation token <sup>created & set null</sup>
- while there are still blobs left in the cloudBlobContainer, the loop goes through & deletes each blob.
